General Description

The XL47Z is a linear Hall-effect sensor specifically engineered for game handle, featuring low power consumption, wide operating voltage, and extended temperature range, with an output voltage varies proportionally with the strength of the induced magnetic field, and its linear output voltage range follows the variation of the power supply voltage. The XL47Z's typical operating voltage is 3.3V, the default zero-point output voltage (without magnetic field) at $V_{DD}=3.3V$ is 1.65V, with low operation current, the operating temperature range supports $-40^{\circ}C\sim 105^{\circ}C$.

The XL47Z integrates high precision current source, temperature compensation module, Hall array, amplifier, driver module and other circuit modules, which provides high linearity and strong immunity to electromagnetic interference over the full voltage range and full temperature range.

Note 2:

(1) Linearity is the degree to which the static characteristic curve between the input and output quantities deviates from a straight line.

(2) The output settling time is the time interval from when the output voltage begins to establish until it stabilizes at 90% of the steady-state output voltage.

XL47Z Magnetic Characteristics (Note 3)

Parameters	Symbol	Test Condition	Min.	Typ.	Max.	Unit
Sensitivity	Sens	$V_{DD}=3.3V$	-2.538	-2.35	-2.162	mV/Gs

Note 3:

(1) The magnetic South Pole (S) is defined as the positive magnetic field. The sensitivity in the table corresponds to measurements taken with the magnetic field perpendicular to the chip's marking surface.

(2) XL47Z is optimized for unipolar applications of game handle. When $V_{DD}=3.3V$, the sensitivity corresponding to output voltage is in the linear range of 0.8V~2.5V as shown in the table. When $V_{DD}=5.0V$, the sensitivity corresponding to output voltage is in the linear range of 0.8V~4.2V as shown in the table.
