General Description

The XL594 is a linear Hall sensor optimized for wide voltage and temperature ranges, with an output voltage that varies proportionally to the supply voltage, and proportional to the strength of the magnetic field it senses. The XL594's output voltage without magnetic field defaults to half of the supply voltage, the chip's typical operating voltage is 5.0V, with an ultimate withstand voltage of up to 50V, and a typical value of sensitivity of 1.6mV/Gs. The operating temperature range supports -40°C ~ 125°C . It is widely used in consumer and industrial control applications.

The XL594 integrates high precision current source, temperature compensation module, Hall array, amplifier, driver module and other circuit modules, which provides high linearity and strong immunity to electromagnetic interference over the full voltage range and full temperature range.
